## iOS – Day 1 Project description

In this project, you build a single page iOS app, *MovieSearch*, with the following functionality:

- 1. The user enters words in a title of a (some) movie(s).
- 2. The words are used as an http query into a movie database, which returns a collection of movies that match the given query.
- 3. The app displays the first movie title found.

The UI should look (something like) this:

Carrier 🛜	7:44 PM	<b>—</b>
ourror v		
<b>-</b>	1. 1	
Enter word	ds in movie title:	
Deer		
	Get movie	
	Sectionic	

The Deer Hunter

## The Visual Studio Project:

- Create a new project in Visual Studio: File New Project Visual C# -Cross-Platform - Blank App (Native Portable)
  - o MovieSearch: The Portable Class Library (PCL)
  - o MovieSearch.iOS: The iOS project
  - o MovieSearch.Droid: The Android project (not used for now)
  - o MovieSearch.WinPhone: Remove this project!

## The movie database:

- Sign up at <a href="https://www.themoviedb.org/">https://www.themoviedb.org/</a> to obtain an API key.
- Add the NuGet package *TheMovieDbWrapper* to your iOS project.
- Study the README.md file at <a href="https://github.com/nCubed/TheMovieDbWrapper">https://github.com/nCubed/TheMovieDbWrapper</a> to understand how to use the package.
- Your implementation of IMovieDbSettings interface should be in the PCL
